

# CBT Skill Acquisition: Life Skills

## Background

*Interactive Journaling*<sup>®</sup> is an evidence-based process rooted in a cognitive-behavioral approach. Though several theories exist to describe why people improve as a result of participating in a CBT based program, the acquisition of particular skills related to cognitive restructuring and behavioral activation scores are two factors that consistently predict behavior change.

With a foundation in cognitive-behavioral therapy, The Change Companies Life Skills Series is designed to help participants work on practical life skills and take steps to make them part of their daily routine.

## Description

The CBTSQ: Life Skills Series is a 28-item, self-report questionnaire that measures current CBT skills use in those working on practical life skills. It is designed to be completed by participants at two time points: prior to beginning the Journal and following completion of the Journal. It is estimated that it will take approximately 10 minutes for people to complete this paper-pencil measure.

This measure is a modified version of the Cognitive Behavioral Therapy Skills Questionnaire (CBTSQ), an instrument with sound psychometric properties, including good overall internal consistency (overall:  $\alpha = .91$ ; BA:  $\alpha = .85$ ; CR:  $\alpha = .88$ ). A validation study (Jacob, Christopher and Neuhaus, 2011) reported expected correlations with a variety of constructs among a large sample of patients receiving intensive CBT in a partial hospital setting.

There are three factors measured by this instrument:

Behavioral Activation (BA: 7 items),  
Cognitive Restructuring (CR: 9 items),  
Life Skills Objectives (LS: 12 items)

Note: Regardless of whether you are having participants complete the entire Journal or specific parts of the journal, the CBTSQ items 1-16 should be included in the pre- or post-test you administer.

## Scoring

Sum the responses for each factor to compute a factor score:

Behavioral Activation items = 1 4 5 9 10 11 13  
Cognitive Restructuring items = 2 3 6 7 8 12 14 15 16  
Life Skills Objectives = 17-28 (sequential)

Scoring can be further broken down by the four journals comprising the Life Skills Series to create subscales of specific journal objectives:

Feelings: 17-19  
Healthy Relationships: 20-22  
Life Management: 23-25  
Coping Skills: 25-28

# CBT Skill Acquisition: Life Skills

BA factor scores range from 0 to 35, and higher scores indicate greater use of BA skills.

CR factor scores range from 0 to 45, and higher scores indicate greater use of CR skills.

WAM objectives scores range from 0 to 60, with higher scores indicating greater understanding and application of Journal content.

Life Skills Journal-specific subscale scores range from 0 to 15 with higher scores indicating greater understanding and application of specific journal content.

## Data Entry and Analysis

To understand changes in scores in participants completing the program, the appropriate statistical test is a paired t-test. A paired t-test measures whether means from a within-subjects test group vary prior to and after being exposed to the Life Skills curriculum.

We recommend you store participant summary data at an item level (i.e., with all 28 items individually entered to allow computation of factor scores, Journal specific scores and total scores) in an electronic spreadsheet, assigning patients a unique ID and storing data without identifying information for HIPAA compliance reasons. Note that in order to complete this analysis you must have matched data, meaning the same identifier must be used for participants at each time point.

Train for Change Inc.® offers comprehensive evaluation and reporting packages. Please contact us for further information.

## Reporting Scores Sample

A paired-samples t-test was conducted to compare pre and post test scores for (n=xx) people participating in our program that utilized The Change Companies'® Life Skills curriculum. There was a significant/not a significant) difference in pre test scores (M=\_\_\_, SD=\_\_\_) and post-test scores (M=\_\_\_, SD=\_\_\_);  $t(\_) = \_$ ,  $p = \_$ .
